SUMMARY

Semi-Senior Full Stack Developer with 4+ years building and shipping web and mobile products end to end with React, React Native, Node.js, and TypeScript on PostgreSQL and Google Cloud. I ship generative-AI features inside products, not just prototypes: a multi-provider layer over Anthropic (Claude), OpenAI, and Gemini that powers tool-calling chat, configurable agents, and an agentic conversational dashboard. Separately, I wrote the rules AI-assisted code must pass and automated ~34 quality checks that hold generated code to the same bar as hand-written code. I own authentication, multi-tenant security, and cloud delivery, and I write boring, predictable code that ships in hours instead of days.

SKILLS

- Languages: TypeScript, JavaScript, SQL
- Frontend: React 18, Next.js, Vite, React Router, Zustand, i18next, TailwindCSS, Shadcn/UI
- Mobile: React Native, Expo (Expo Router, secure-store, auth-session), iOS and Android
- Backend: Node.js, Express, REST APIs, WebSockets, real-time streaming
- Data: PostgreSQL 16, Drizzle ORM, Redis, schema migrations
- Generative AI in product: Anthropic (Claude), OpenAI, and Gemini SDKs; multi-provider abstraction, BYOK (bring-your-own-key), token streaming, prompt caching, usage and cost accounting, tool-calling, AI agents, agentic loops, voice transcription (OpenAI Realtime API, Whisper)
- Security: JWT, Argon2 password hashing, RBAC (permission guards), multi-tenant isolation, Helmet, rate limiting, Zod validation, OWASP-aligned practices
- Cloud and DevOps: Google Cloud (Cloud Run, Cloud SQL, Cloud Storage, Firebase Hosting), AWS S3, Docker, CI/CD (GitHub Actions), Workload Identity Federation, per-environment deployments
- AI-assisted development: Claude Code, automated quality gates, deterministic check scripts

EXPERIENCE

Semi-Senior Full Stack Developer — Baleares Group

May 2022 – Present | Remote

Full stack development and requirements analysis for clients across several industries. Web and mobile apps built with React, React Native (Expo), Node.js, and TypeScript on top of the company's internal modular platform.

- Shipped generative-AI product features: a multi-provider layer over Anthropic (Claude), OpenAI, and Gemini with per-organization BYOK, token streaming, and prompt caching, powering tool-calling chat, configurable AI agents, an agentic conversational dashboard that builds KPIs and charts from project data, and streaming voice transcription.
- Wrote the rules AI-generated code must pass and automated ~34 deterministic quality checks enforced in three layers (a local pre-close hook, CI on every pull request, and a deploy-composition wall), running as a dedicated Quality gate and Security Risk Assessment in CI so AI-written code ships to the same bar as hand-written code.
- Contributed from the foundations to the internal modular platform, published as versioned packages and consumed by 8+ client products in production, including its optional self-registering capability system with contract and isolation gates.
- Owned authentication and multi-tenant security: JWT, Argon2 password hashing, permission-based RBAC guards, per-organization data isolation enforced automatically, Helmet, rate limiting, and Zod validation, aligned with OWASP practices.
- Migrated 6 client legacy systems onto the platform in under a month, working directly with each client; ran one end to end myself, platform and React Native (Expo) app included, then handed it off to the team when I was moved to a larger client.
- Built the automation that brought every project into compliance with the company's per-environment infrastructure

standards (CI/CD to Cloud Run, Cloud SQL, and Firebase Hosting), and migrated legacy projects off virtual machines and onto it, delivering isolated environments, automated deployments, and lower operating costs.

- Set up multi-environment CI/CD with separate Development, Staging, and Production workflows plus versioned package publishing, release tagging, and release notifications; the platform pipeline has run 400+ workflow executions, including 190+ automated deployments to the development environment (several per day).
- Standardized the delivery process so features and bug fixes ship in hours instead of days and client demos in days instead of weeks.
- Worked directly with the CEO and CTO on technical guidelines and architectures for client projects.

PROJECTS

SaaS Starter — Open Source

Personal project. Full-stack SaaS starter template built with Next.js, TypeScript, and Kysely on Neon Postgres. Authentication with Auth.js (OAuth via Google, Auth0, and GitHub), payments with Stripe, transactional email with React Email and Resend, UI with Shadcn/UI, deployed on Vercel. GitHub: github.com/eynort

Developer Portfolio — Open Source

Personal site and portfolio built with Next.js and TypeScript, fully bilingual (English/Spanish) with an i18n dictionary layer. Source is public.

EDUCATION AND CERTIFICATIONS

- CS50: Introduction to Computer Science — Harvard University (edX), 2024
- freeCodeCamp — JavaScript Algorithms and Data Structures, 2021
- freeCodeCamp — Responsive Web Design, 2021

LANGUAGES

- Spanish: Native
